

PM School Challenge Concept

HopCharge ⚡

Improving Customer Retention and Average Revenue Per User (ARPU)

1. Problem Statement

Redefined Problem Statement

HopCharge provides on-demand, mobile EV charging to users without access to home infrastructure. However, with the rapid expansion of fixed fast-charging networks, HopCharge needs to transition ad-hoc users into loyal, recurring subscribers. We need to develop product features to increase **Customer Retention by 25%** and **ARPU by 15%** by Q4 2025.

Problem Teardown

High Churn Rate → Decreased ARPU → Underutilized Mobile Vans → Reduced Margins → Slower Expansion

Value Proposition

- **To Customers:** Unparalleled convenience, time saved, and elimination of range

2. Company Overview

About HopCharge

HopCharge operates a "virtual energy cloud" using specialized vans equipped with proprietary energy pods to deliver fast charging directly to a customer's location, eliminating grid dependencies.

Revenue Model

- **Pay-Per-Use:** Ad-hoc mobile charging for emergencies or top-ups.
- **Subscription (HopchargeX):** Monthly plans for regular charging.
- **B2B / OEM:** Bundled charging for new EV buyers (e.g., Tata.ev).

Target Audience

- Tier 1 Urban Residents living in multi-story apartments without dedicated parking.
- Busy professionals who value time over the premium cost of mobile charging.

3. Competitor Analysis

Parameters	HopCharge	Tata Power (Fixed)	Mobec (Mobile)
Model	Mobile / On-Demand	Fixed Stations	Mobile / On-Demand
Target User	Convenience / No home charger	Highway / Routine	Convenience
Pricing	Premium + Subscription	Standard Pay-per-kWh	Premium
Delivery Time	Scheduled / On-Demand	N/A (Travel required)	Scheduled
Key Advantage	Zero grid setup, doorstep delivery	Massive nationwide network	Emerging flexibility

4. Market Sizing (India EV Charging)

TAM (Total Addressable Market): \$5.5 Billion

The projected EV charging infrastructure market in India by 2027.

SAM (Serviceable Available Market): \$1.2 Billion

Urban residential and commercial EV charging demand (Tier-1 cities).

SOM (Serviceable Obtainable Market): \$150 Million

Targeted revenue for on-demand mobile charging solutions in major metros over the next 3 years.

5. User Personas

Apartment Resident (Aarav, 34)

- **Characteristics:** Lives in a high-rise without a dedicated EV charger. Relies on public networks.
- **Pain Points:** Waiting in queues at public chargers; "charging anxiety" before long trips.
- **Needs:** Reliable, recurring charging at home.

Busy Professional (Neha, 29)

- **Characteristics:** Values time heavily. Drives to the office daily.
- **Pain Points:** Wasting 45+ minutes at a fast-charging station during work hours.
- **Needs:** Seamless charging while the car is parked at the office.

6. Proposed Features

Feature 1: Predictive Smart Scheduling

The app integrates with the vehicle's telematics (or learns usage patterns) to predict when the battery will drop below 20%. It preemptively sends a push notification to schedule a HopCharge van exactly when the car is parked at home/office.

- **Benefit:** Increases frequency of use and reduces user cognitive load.

Feature 2: Neighborhood Pod-Sharing

Users can "host" a charging slot. If multiple EVs in the same apartment complex or office park book the same HopCharge van in a 2-hour window, all users get a 15% discount.

- **Benefit:** Massively improves van utilization, reduces travel time between customers, and creates community-driven virality.

7. Proposed Features (Cont.)

Feature 3: HopCoins Gamification

Introduce a reward system where users earn "HopCoins" for maintaining a charging streak (e.g., booking 3 times a month). Coins can be redeemed for free premium time-slots, priority routing during peak hours, or car cleaning add-ons.

- **Benefit:** Directly tackles retention by creating switching costs and habit-building.

8. RICE Prioritization

Features	Reach (1-10)	Impact (1-10)	Confidence (%)	Effort (1-10)	Score
Neighborhood Sharing	8	9	80%	6	9.6 (1st)
Predictive Scheduling	6	8	70%	8	4.2 (3rd)
HopCoins Gamification	10	7	90%	7	9.0 (2nd)

9. Go-To-Market (GTM) Strategy

Phase 1: Neighborhood Sharing (Months 1-2)

- Launch a pilot in dense tech parks and specific high-rise societies in Gurgaon/Bengaluru.
- Distribute referral codes to Residents' Welfare Associations (RWAs).

Phase 2: HopCoins Rollout (Months 3-4)

- Introduce the wallet system via an app update.
- Seed existing HopchargeX subscribers with bonus coins to kickstart engagement.

Phase 3: Predictive Analytics (Months 5-6)

- Partner with OEMs for telematics API integration.
- Soft launch to heavy users first to train the prediction algorithm.

10. Key Metrics to Track

North Star Metric:

- **Average Revenue Per User (ARPU):** Track the shift from single ad-hoc uses to recurring monthly spend.

Primary Metrics:

- **Customer Retention Rate:** Percentage of users who book >2 times a month.
- **Van Utilization Rate:** Average hours per day a HopCharge van is actively charging vs. travelling.

Secondary Metrics:

- **Community Adoption:** Number of multi-car bookings per location (Neighborhood sharing).
- **Gamification Engagement:** Percentage of HopCoins redeemed within 30 days of
